FactoMineR-package  Multivariate Exploratory Data Analysis and Data Mining with R

Description

The method proposed in this package are exploratory multivariate methods such as principal component analysis, correspondence analysis or clustering.

Details

Package: FactoMineR
Type: Package
Version: 1.28
Date: 2014-09-26
License: GPL
LazyLoad: yes

Author(s)

AovSum

Analysis of variance with the contrasts sum (the sum of the coefficients is 0)

Description

Analysis of variance with the contrasts sum (the sum of the coefficients is 0)
Test for all the coefficients
Handle missing values

Usage

AovSum(formula, data, na.action = na.omit, ...)

Arguments

formula the formula for the model 'y~x1+x2+x1:x2'
data a data-frame
na.action (where relevant) information returned by model.frame on the special handling of NAs.
... other arguments, cf the function lm

Value

Retourne des objets

Ftest a table with the F-tests
Ttest a table with the t-tests

Author(s)

Francois Husson <husson@agrocampus-ouest.fr>

See Also

aov, lm
## Examples

```r
## Example two-way anova
data(senso)
res = AovSum(Score~ Product + Day, data=senso)
res

## Example two-way anova with interaction
data(senso)
res2 = AovSum(Score~ Product + Day + Product : Day, data=senso)
res2

## Example ancova
data(footsize)
res3 = AovSum(footsize ~ size + sex + size : sex, data=footsize)
res3
```

## Description

Function to better position the labels on the graphs.

## Usage

```r
autoLab(x, y = NULL, labels = seq(along = x), cex = 1,
method = c("SANN", "GA"),
allowSmallOverlap = FALSE,
trace = FALSE, shadotext = FALSE,
doPlot = TRUE, ...)
```

## Arguments

- `x` the x-coordinates
- `y` the y-coordinates
- `labels` the labels
- `cex` cex
- `method` not used
- `allowSmallOverlap` boolean
- `trace` boolean
- `shadotext` boolean
- `doPlot` boolean
- `...` further arguments passed to or from other methods

## Value

See the text function
Description

Performs Correspondence Analysis (CA) including supplementary row and/or column points.

Usage

CA(X, ncp = 5, row.sup = NULL, col.sup = NULL, quanti.sup=NULL, quali.sup = NULL, graph = TRUE, axes = c(1,2), row.w = NULL)

Arguments

X a data frame or a table with \( n \) rows and \( p \) columns, i.e. a contingency table
ncp number of dimensions kept in the results (by default 5)
row.sup a vector indicating the indexes of the supplementary rows
col.sup a vector indicating the indexes of the supplementary columns
quanti.sup a vector indicating the indexes of the supplementary continuous variables
quali.sup a vector indicating the indexes of the categorical supplementary variables
graph boolean, if TRUE a graph is displayed
axes a length 2 vector specifying the components to plot
row.w an optional row weights (by default, a vector of 1 and each row has a weight equals to its margin)

Value

Returns a list including:

eig a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance
col a list of matrices with all the results for the column variable (coordinates, square cosine, contributions, inertia)
row a list of matrices with all the results for the row variable (coordinates, square cosine, contributions, inertia)
col.sup a list of matrices containing all the results for the supplementary column points (coordinates, square cosine)
row.sup a list of matrices containing all the results for the supplementary row points (coordinates, square cosine)
quanti.sup if quanti.sup is not NULL, a matrix containing the results for the supplementary continuous variables (coordinates, square cosine)
quali.sup if quali.sup is not NULL, a list of matrices with all the results for the supplementary categorical variables (coordinates of each categories of each variables, v.test which is a criterion with a Normal distribution, square correlation ratio)
call a list with some statistics

Returns the row and column points factor map. The plot may be improved using the argument autolab, modifying the size of the labels or selecting some elements thanks to the plot.CA function.

Author(s)

Francois Husson <Francois.Husson@agrocampus-ouest.fr>, Jeremy Mazet

CaGalt Correspondence Analysis on Generalised Aggregated Lexical Table (CaGalt)

Description

Correspondence Analysis on Generalised Aggregated Lexical Table (CaGalt) aims at expanding correspondence analysis on an aggregated lexical table to the case of several quantitative and categorical variables with the objective of establishing a typology of the variables and a typology of the frequencies from their mutual relationships. To avoid the instability issued from multicollinearity among the contextual variables and limit the influence of noisy measurements, the contextual variables are substituted by their principal components. Validation tests in the form of confidence ellipses for the frequencies and the variables are also proposed.
Usage

CaGalt(Y, X, type="s", conf.ellip=FALSE, nb.ellip=100, level.ventil=0,
        sx=NULL, graph=TRUE, axes=c(1,2))

Arguments

Y               a data frame with n rows (individuals) and p columns (frequencies)
X               a data frame with n rows (individuals) and k columns (quantitative or categorical
                variables)
type            the type of variables: "c" or "s" for quantitative variables and "n" for categorical
                variables. The difference is that for "s" variables are scaled to unit variance (by
                default, variables are scaled to unit variance)
conf.ellip      boolean (FALSE by default), if TRUE, draw confidence ellipses around the fre-
                quencies and the variables when "graph" is TRUE
nb.ellip        number of bootstrap samples to compute the confidence ellipses (by default 100)
level.ventil    proportion corresponding to the level under which the category is ventilated; by
                default, 0 and no ventilation is done. Available only when type is equal to "n"
sx              number of principal components kept from the principal axes analysis of the
                contextual variables (by default is NULL and all principal components are kept)
grap            boolean, if TRUE a graph is displayed
axes            a length 2 vector specifying the components to plot

Value

Returns a list including:
eig             a matrix containing all the eigenvalues, the percentage of variance and the cu-
                mulative percentage of variance
ind             a list of matrices containing all the results for the individuals (coordinates, square
                cosine)
freq            a list of matrices containing all the results for the frequencies (coordinates,
                square cosine, contributions)
quanti.var      a list of matrices containing all the results for the quantitative variables (coordinates,
                correlation between variables and axes, square cosine)
quali.var       a list of matrices containing all the results for the categorical variables (coordinates
                of each categories of each variables, square cosine)
ellip           a list of matrices containing the coordinates of the frequencies and variables for
                replicated samples from which the confidence ellipses are constructed

Returns the individuals, the frequencies and the variables factor map. If there are more than 50
frequencies, the first 50 frequencies that have the highest contribution on the 2 dimensions of your
plot are drawn. The plots may be improved using the argument autolab, modifying the size of the
labels or selecting some elements thanks to the plot.CaGalt function.

## End(Not run)
```

catdes

Categories description

Description
Description of the categories of one factor by categorical variables and/or by quantitative variables

Usage
catdes(donnee,num.var,proba = 0.05, row.w = NULL)

Arguments
donnee a data frame made up of at least one categorical variables and a set of quantitative variables and/or categorical variables
num.var the indice of the variable to characterized
proba the significance threshold considered to characterized the category (by default 0.05)
row.w a vector of integers corresponding to an optional row weights (by default, a vector of 1 for uniform row weights)
Value

Returns a list including:

- `test.chi`: The categorical variables which characterized the factor are listed in ascending order (from the one which characterized the most the factor to the one which significantly characterized with the probability of deviation).
- `category`: Description of each category of the `num.var` by each category of all the categorical variables.
- `quanti.var`: The global description of the `num.var` variable by the quantitative variables with the square correlation coefficient and the p-value of the F-test in a one-way analysis of variance (assuming the hypothesis of homoscedasticity).
- `quanti`: The description of each category of the `num.var` variable by the quantitative variables.

`plot.catdes`, `condes`

Examples

```r
data(wine)
catdes(wine, num.var=2)
```

Description

The data used here is a contingency table that summarizes the answers given by different categories of people to the following question: according to you, what are the reasons that can make hesitate a woman or a couple to have children?

Usage

```r
data(children)
```
CoeffRV

Format

A data frame with 18 rows and 8 columns. Rows represent the different reasons mentioned, columns represent the different categories (education, age) people belong to.

Source

Traitements Statistiques des Enquêtes (D. Grangé, L. Lebart, eds.) Dunod, 1993

Examples

data(children)
res.ca <- CA(children, row.sup = 15:18, col.sup = 6:8)

---

CoeffRV

Calculate the RV coefficient and test its significance

Description

Calculate the RV coefficient and test its significance.

Usage

CoeffRV(X, Y)

Arguments

X a matrix with n rows (individuals) and p numerous columns (variables)
Y a matrix with n rows (individuals) and p numerous columns (variables)

Details

Calculates the RV coefficient between X and Y. It returns also the standardized RV, the expectation, the variance and the skewness under the permutation distribution. These moments are used to approximate the exact distribution of the RV statistic with the Pearson type III approximation and the p-value associated to this test is given.

Value

A list containing the following components:

RV the RV coefficient between the two matrices
RVs the standardized RV coefficients
mean the mean of the RV permutation distribution
variance the variance of the RV permutation distribution
skewness the skewness of the RV permutation distribution
p.value the p-value associated to the test of the significativity of the RV coefficient (with the Pearson type III approximation)

Examples

data(wine)
X <- wine[,3:7]
Y <- wine[,11:20]
coeffRV(X,Y)

condes  
Continuous variable description

Description

Description continuous by quantitative variables and/or by categorical variables

Usage

condes(donnee,num.var,weights=NULL,proba = 0.05)

Arguments

donnee  a data frame made up of at least one quantitative variable and a set of quantitative variables and/or categorical variables
num.var the number of the variable to characterized
weights weights for the individuals; if NULL, all individuals has a weight equals to 1; the sum of the weights can be equal to 1 and then the weights will be multiplied by the number of individuals, the sum can be greater than the number of individuals
proba the significance threshold considered to characterized the category (by default 0.05)
Value

Returns a list including:

quanti

the description of the num.var variable by the quantitative variables. The variables are sorted in ascending order (from the one which characterized the most to the one which significantly characterized with the proba proba)

quali

The categorical variables which characterized the continuous variables are listed in ascending order

category

description of the continuous variable num.var by each category of all the categorical variables

Author(s)

Francois Husson <Francois.Husson@agrocampus-ouest.fr>

coord.ellipse  Construct confidence ellipses

Description

Construct confidence ellipses

Usage

coord.ellipse (coord.simul, centre = NULL, axes = c(1, 2),
level.conf = 0.95, npoint = 100, bary = FALSE)

Arguments

coord.simul  a data frame containing the coordinates of the individuals for which the confidence ellipses are constructed. This data frame can contain more than 2 variables; the variables taken into account are chosen after. The first column must be a factor which allows to associate one row to an ellipse. The simule object of the result of the simule function correspond to a data frame.

centre  a data frame whose columns are the same than those of the coord.simul, and with the coordinates of the centre of each ellipse. This parameter is optional and NULL by default; in this case, the centre of the ellipses is calculated from the data
decathlon

axes  a length 2 vector specifying the components of coord.simul that are taken into account
level.conf  confidence level used to construct the ellipses. By default, 0.95
npoint  number of points used to draw the ellipses
bary  boolean, if bary = TRUE, the coordinates of the ellipse around the barycentre of individuals are calculated

Value
res  a data frame with (npoint times the number of ellipses) rows and three columns. The first column is the factor of coord.simul, the two others columns give the coordinates of the ellipses on the two dimensions chosen.
call  the parameters of the function chosen

Author(s)
Jeremy Mazet

simule

Examples
data(decathlon)
res.pca <- PCA(decathlon, quanti.sup = 11:12, quali.sup = 13, graph=FALSE)
aa <- cbind.data.frame(decathlon[,13],res.pca$ind$coord)
bb <- coord.ellipse(aa,bary=TRUE)
plot(res.pca,habillage=13,ellipse=bb)

### To automatically draw ellipses around the barycentres of all the categorical variables
plotellipses(res.pca)

---
decathlon  Performance in decathlon (data)

Description

The data used here refer to athletes’ performance during two sporting events.

Usage
data(decathlon)
descfreq

Format
A data frame with 41 rows and 13 columns: the first ten columns corresponds to the performance of the athletes for the 10 events of the decathlon. The columns 11 and 12 correspond respectively to the rank and the points obtained. The last column is a categorical variable corresponding to the sporting event (2004 Olympic Game or 2004 Decastar).

Source
Département de mathématiques appliquées, Agrocampus Rennes

Examples
data(decathlon)
res.pca <- PCA(decathlon, quanti.sup = 11:12, quali.sup=13)

----------
descfreq
Description of frequencies
----------

Description
Description of the rows of a contingency table or of groups of rows of a contingency table

Usage
descfreq(donnee, by.quali = NULL, proba = 0.05)

Arguments
donnee a data frame corresponding to a contingency table (quantitative data)
by.quali a factor used to merge the data from different rows of the contingency table; by default NULL and each row is characterized
proba the significance threshold considered to characterized the category (by default 0.05)

Value
Returns a list with the characterization of each rows or each group of the by.quali. A test corresponding to the hypergeometric distribution is performed and the probability to observe a more extreme value than the one observed is calculated. For each row (or category), each of the columns characterising the row are sorted in ascending order of p-value.

dimdesc  
*Dimension description*

Description
This function is designed to point out the variables and the categories that are the most characteristic according to each dimension obtained by a Factor Analysis.

Usage
dimdesc(res, axes = 1:3, proba = 0.05)

Arguments
- `res`: an object of class PCA, MCA, CA, MFA or HMFA
- `axes`: a vector with the dimensions to describe
- `proba`: the significance threshold considered to characterized the dimension (by default 0.05)

Value
Returns a list including:
- `quanti`: the description of the dimensions by the quantitative variables. The variables are sorted.
- `quali`: the description of the dimensions by the categorical variables

DMFA   Dual Multiple Factor Analysis (DMFA)

Description
Performs Dual Multiple Factor Analysis (DMFA) with supplementary individuals, supplementary quantitative variables and supplementary categorical variables.

Usage
DMFA(don, num adultos = ncol(data), scale.unit = TRUE, ncp = 5,
      quanti.sup = NULL, quali.sup = NULL, graph = TRUE, axes=c(1,2))

Arguments
- **don**  a data frame with \( n \) rows (individuals) and \( p \) columns (numeric variables)
- **num adultes**  the number of the categorical variable which allows to make the group of individuals
- **scale.unit**  a boolean, if TRUE (value set by default) then data are scaled to unit variance
- **ncp**  number of dimensions kept in the results (by default 5)
- **quanti.sup**  a vector indicating the indexes of the quantitative supplementary variables
- **quali.sup**  a vector indicating the indexes of the categorical supplementary variables
- **graph**  boolean, if TRUE a graph is displayed
- **axes**  a length 2 vector specifying the components to plot
Value

Returns a list including:

- **eig**: a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance
- **var**: a list of matrices containing all the results for the active variables (coordinates, correlation between variables and axes, square cosine, contributions)
- **ind**: a list of matrices containing all the results for the active individuals (coordinates, square cosine, contributions)
- **ind.sup**: a list of matrices containing all the results for the supplementary individuals (coordinates, square cosine)
- **quanti.sup**: a list of matrices containing all the results for the supplementary quantitative variables (coordinates, correlation between variables and axes)
- **quali.sup**: a list of matrices containing all the results for the supplementary categorical variables (coordinates of each categories of each variables, and v.test which is a criterion with a Normal distribution)
- **svd**: the result of the singular value decomposition
- **var.particle**: a list with the partial coordinate of the variables for each group
- **cor.dim.gr**: a list with the data centered by group
- **group**: a list with the results for the groups (coordinates, normalized coordinates, cos2)
- **Cov**: a list with the covariance matrices for each group

Returns the individuals factor map and the variables factor map.

Author(s)

François Husson <Francois.Husson@agrocampus-ouest.fr>

See Also

- plot.DMFA, dimdesc

Examples

```r
## Example with the famous Fisher's iris data
res.dmfa = DMFA(iris, num.fact = 5)
```
**Description**

Draw confidence ellipses in CA around rows and/or columns.

**Usage**

```r
ellipseCA(x, ellipse=c("col","row"), method="multinomial", nbsample=100,
   axes=c(1,2), xlim=NULL, ylim=NULL, col.row="red", col.col="blue",
   col.row.ell=col.row, col.col.ell=col.col, ...)
```

**Arguments**

- `x` an object of class CA
- `ellipse` a vector of character that defines which ellipses are drawn
- `method` the method to construct ellipses (see details below)
- `nbsample` number of samples drawn to evaluate the stability of the points
- `axes` a length 2 vector specifying the components to plot
- `xlim` range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
- `ylim` range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
- `col.row` a color for the rows points
- `col.col` a color for columns points
- `col.row.ell` a color for the ellipses of rows points (the color "transparent" can be used if an ellipse should not be drawn)
- `col.col.ell` a color for the ellipses of columns points (the color "transparent" can be used if an ellipse should not be drawn)
- `...` further arguments passed to or from the plot.CA function, such as title, invisible,

**Details**

With `method="multinomial"`, the table X with the active elements is taken as a reference. Then new data tables are drawn in the following way: N (the sum of X) values are drawn from a multinomial distribution with theoretical frequencies equals to the values in the cells divided by N.

With `method="boot"`, the values are bootstrapped row by row: Ni (the sum of row i in the X table) values are taken in a vector with Nij equals to column j (with j varying from 1 to J).

Thus `nbsample` new datasets are drawn and projected as supplementary rows and/or supplementary columns. Then confidence ellipses are drawn for each elements thanks to the `nbsample` supplementary points.
Value

Returns the factor map with the joint plot of CA with ellipses around some elements.

## Ellipses around some columns only
ellipseCA(res.ca, ellipse="col", col.col.ell=c(rep("blue",2),rep("transparent",3)),
invisible=c("row.sup","col.sup"))

estim_ncp

Estimate the number of components in Principal Component Analysis

Description

Estimate the number of components in PCA.

Usage

estim_ncp(X, ncp.min=0, ncp.max=NULL, scale=TRUE, method="GCV")

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>a data frame with continuous variables</td>
</tr>
<tr>
<td>ncp.min</td>
<td>minimum number of dimensions to interpret, by default 0</td>
</tr>
<tr>
<td>ncp.max</td>
<td>maximum number of dimensions to interpret, by default NULL which corresponds to the number of columns minus 2</td>
</tr>
<tr>
<td>scale</td>
<td>a boolean, if TRUE (value set by default) then data are scaled to unit variance</td>
</tr>
<tr>
<td>method</td>
<td>method used to estimate the number of components, &quot;GCV&quot; for the generalized cross-validation approximation or &quot;Smooth&quot; for the smoothing method (by default &quot;GCV&quot;)</td>
</tr>
</tbody>
</table>
Value

Returns ncp the best number of dimensions to use (find the minimum or the first local minimum) and the mean error for each dimension tested.

PCA

Examples

data(decathlon)
nb.dim <- estim_ncp(decathlon[,1:10],scale=TRUE)

Description

FAMD is a principal component method dedicated to explore data with both continuous and categorical variables. It can be seen roughly as a mixed between PCA and MCA. More precisely, the continuous variables are scaled to unit variance and the categorical variables are transformed into a disjunctive data table (crisp coding) and then scaled using the specific scaling of MCA. This ensures to balance the influence of both continuous and categorical variables in the analysis. It means that both variables are on an equal foot to determine the dimensions of variability. This method allows one to study the similarities between individuals taking into account mixed variables and to study the relationships between all the variables. It also provides graphical outputs such as the representation of the individuals, the correlation circle for the continuous variables and representations of the categories of the categorical variables, and also specific graphs to visualize the associations between both type of variables.

Usage

FAMD (base, ncp = 5, graph = TRUE, sup.var = NULL,
    ind.sup = NULL, axes = c(1,2), row.w = NULL, tab.comp = NULL)
 Arguments

- **base**: a data frame with \( n \) rows (individuals) and \( p \) columns
- **ncp**: number of dimensions kept in the results (by default 5)
- **graph**: boolean, if TRUE a graph is displayed
- **ind.sup**: a vector indicating the indexes of the supplementary individuals
- **sup.var**: a vector indicating the indexes of the supplementary variables
- **axes**: a length 2 vector specifying the components to plot
- **row.w**: an optional row weights (by default, uniform row weights)
- **tab.comp**: object obtained from the imputeFAMD function of the missMDA package that allows to handle missing values

 Value

Returns a list including:

- **eig**: a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance
- **var**: a list of matrices containing all the results for the variables considered as group (R2, coordinates, square cosine, contributions, distance to the origin, the R2 between each variable and each factor)
- **ind**: a list of matrices with all the results for the individuals (coordinates, square cosine, contributions)
- **quali.var**: a list of matrices with all the results for the categorical variables (coordinates, square cosine, contributions, v.test)
- **quanti.var**: a list of matrices with all the results for the quantitative variables (coordinates, correlation, square cosine, contributions)
- **call**: a list with some statistics

 Returns the individuals factor map.

---

**Description**

Dataset for the covariance analysis (a quantitative variable explained by quantitative (continuous) and qualitative (categorical) variables)

**Usage**

data(footsize)

**Format**

Dataset with 84 rows and 3 columns: footsize, size and sex

**Examples**

data(footsize)
res3 <- AovSum (footsize ~ size + sex + size : sex, data=footsize)
res3

---

**Description**

The data used here concern a geomorphology analysis.

**Usage**

data(geomorphology)
Format
A data frame with 75 rows and 11 columns. Rows represent the individuals, columns represent the different questions. 10 variables are quantitative and one variable is qualitative. The dataset is analysed in: http://www.sciencedirect.com/science/article/pii/S0169555X11006362

Examples

data(geomorphology)
res <- FAMD(geomorphology)
plot(res,choix="ind",habillage=4)

GPA

Generalised Procrustes Analysis

Description
Performs Generalised Procrustes Analysis (GPA) that takes into account missing values.

Usage
GPA(df, tolerance=10^-10, nbiteration=200, scale=TRUE,
group, name.group = NULL, graph = TRUE, axes = c(1,2))

Arguments

df a data frame with n rows (individuals) and p columns (quantitative variables)
tolerance a threshold with respect to which the algorithm stops, i.e. when the difference between the GPA loss function at step n and n+1 is less than tolerance
nbiteration the maximum number of iterations until the algorithm stops
scale a boolean, if TRUE (which is the default value) scaling is required
group a vector indicating the number of variables in each group
name.group a vector indicating the name of the groups (the groups are successively named group.1, group.2 and so on, by default)
graph boolean, if TRUE a graph is displayed
axes a length 2 vector specifying the components to plot

Details
Performs a Generalised Procrustes Analysis (GPA) that takes into account missing values: some data frames of df may have non described or non evaluated rows, i.e. rows with missing values only.
The algorithm used here is the one developed by Commandeur.
Value

A list containing the following components:

- **RV**: a matrix of RV coefficients between partial configurations
- **RVs**: a matrix of standardized RV coefficients between partial configurations
- **simi**: a matrix of Procrustes similarity indexes between partial configurations
- **scaling**: a vector of isotropic scaling factors
- **dep**: an array of initial partial configurations
- **consensus**: a matrix of consensus configuration
- **xfin**: an array of partial configurations after transformations
- **correlations**: correlation matrix between initial partial configurations and consensus dimensions
- **PANOVA**: a list of “Procrustes Analysis of Variance” tables, per assessor (config), per product (objet), per dimension (dimension)

Author(s)

Elisabeth Morand

Examples

```r
## Not run:
data(wine)
res.gpa <- GPA(wine[, -(1:2)], group=c(5,3,10,9,2),
           name.group=c("olf","vis","olfag","gust","ens"))

### If you want to construct the partial points for some individuals only
plotGPApartial(res.gpa)

## End(Not run)
```
graph.var  

Make graph of variables

Description

Plot the graphs of the variables after a Factor Analysis.

Usage

```r
graph.var(x, axes = c(1, 2),
           xlim = NULL, ylim = NULL, col.sup = "blue",
           col.var = "black", draw="all", label=draw, lim.cos2.var = 0.1,
           cex = 1, title = NULL, new.plot = TRUE, ...)
```

Arguments

- `x` an object of class PCA, MCA, MFA or HMFA
- `axes` a length 2 vector specifying the components to plot
- `xlim` range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
- `ylim` range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
- `col.sup` a color for the quantitative supplementary variables
- `col.var` a color for the variables
- `draw` a list of character for the variables which are drawn (by default, all the variables are drawn). You can draw all the active variables by putting "var" and/or all the supplementary variables by putting "quanti.sup" and/or a list with the names of the variables which should be drawn
- `label` a list of character for the variables which are labelled (by default, all the drawn variables are labelled). You can label all the active variables by putting "var" and/or all the supplementary variables by putting "quanti.sup" and/or a list with the names of the variables which should be labelled
- `lim.cos2.var` value of the square cosinus under the variables are not drawn
- `cex` cf. function `par` in the `graphics` package
- `title` string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
- `new.plot` boolean, if TRUE, a new graphical device is created
- `...` further arguments passed to or from other methods

Value

Returns the variables factor map.
HCPC

Author(s)
Francois Husson <Francois.Husson@agrocampus-ouest.fr>

See Also
PCA, MFA, MCA, DMFA, HMFA

Examples

data(decathlon)
res.pca <- PCA(decathlon, quanti.sup = 11:12, quali.sup = 13, graph = FALSE)
graph.var (res.pca, draw = c("var","Points"),
       label = c("Long.jump", "Points"))

HCPC  Hierarchical Clustering on Principle Components (HCPC)

Description
Performs an agglomerative hierarchical clustering on results from a factor analysis. It is possible to
cut the tree by clicking at the suggested (or an other) level. Results include paragons, description of
the clusters, graphics.

Usage
HCPC(res, nb.clust=0, consol=TRUE, iter.max=10, min=3,
     max=NULL, metric="euclidean", method="ward", order=TRUE,
     graph.scale="inertia", nb.par=5, graph=TRUE, proba=0.05,
     cluster.CA="rows", kk=Inf,...)

Arguments

res         Either the result of a factor analysis or a dataframe.

nb.clust    an integer. If 0, the tree is cut at the level the user clicks on. If -1, the tree is
            automatically cut at the suggested level (see details). If a (positive) integer, the
            tree is cut with nb.clusters clusters.

consol      a boolean. If TRUE, a k-means consolidation is performed (consolidation cannot
            be performed if kk is used and equals a number).

iter.max    An integer. The maximum number of iterations for the consolidation.

min         an integer. The least possible number of clusters suggested.

max         an integer. The higher possible number of clusters suggested; by default the
            minimum between 10 and the number of individuals divided by 2.

metric      The metric used to built the tree. See agnes for details.

method      The method used to built the tree. See agnes for details.
order  A boolean. If TRUE, clusters are ordered following their center coordinate on the first axis.

graph.scale  A character string. By default "inertia" and the height of the tree corresponds to the inertia gain, else "sqrt-inertia" the square root of the inertia gain.

nb.par  An integer. The number of edited paragons.

graph  If TRUE, graphics are displayed. If FALSE, no graph are displayed.

proba  The probability used to select axes and variables in catdes (see catdes for details.

cluster.CA  A string equals to "rows" or "columns" for the clustering of Correspondence Analysis results.

kk  An integer corresponding to the number of clusters used in a Kmeans preprocessing before the hierarchical clustering; the top of the hierarchical tree is then constructed from this partition. This is very useful if the number of individuals is high. Note that consolidation cannot be performed if kk is different from Inf and some graphics are not drawn. Inf is used by default and no preprocessing is done, all the graphical outputs are then given.

...  Other arguments from other methods.

Details

The function first built a hierarchical tree. Then the sum of the within-cluster inertia are calculated for each partition. The suggested partition is the one with the higher relative loss of inertia \(i(\text{clusters } n+1)/i(\text{cluster } n))\).

The absolute loss of inertia \((i(\text{cluster } n)-i(\text{cluster } n+1))\) is plotted with the tree.

If the ascending clustering is constructed from a data-frame with a lot of rows (individuals), it is possible to first perform a partition with kk clusters and then construct the tree from the (weighted) kk clusters.

Value

Returns a list including:

data.clust  The original data with a supplementary row called class containing the partition.

desc.var  The description of the classes by the variables. See catdes for details or descfreq if clustering is performed on CA results.

desc.axes  The description of the classes by the factors (axes). See catdes for details.

call  A list or parameters and internal objects. call$t gives the results for the hierarchical tree; call$bw.before.consol and call$bw.after.consol give the between inertia before consolidation (i.e. for the clustering obtained from the hierarchical tree) and after the consolidation with Kmeans.

ind.desc  The paragons (para) and the more typical individuals of each cluster. See details.

Returns the tree and a barplot of the inertia gains, the individual factor map with the tree (3D), the factor map with individuals coloured by cluster (2D).

Examples

```r
## Not run:
data(iris)
# Principal Component Analysis:
res.pca <- PCA(iris[,1:4], graph=FALSE)
# Clustering, auto nb of clusters:
hc <- HCPC(res.pca, nb.clust=-1)

### Construct a hierarchical tree from a partition (with 10 clusters)
### (useful when the number of individuals is very important)
hc2 <- HCPC(iris[,1:4], kk=10, nb.clust=-1)

## End(Not run)
```

health  

Description

In 1989-1990 the Valencian Institute of Public Health (IVESP) conducted a survey to better know the attitudes and opinions related to health for the non-expert population. The first question included in the questionnaire "What does health mean to you?" required free and spontaneous answers. A priori, the variables Age group (under 21, 21-35, 36-50 and over 50), Health condition (poor, fair, good and very good health) and Gender were considered as possibly conditioning the respondents' viewpoint on health.

Usage

data(health)

Format

A data frame with 392 rows and 118 columns. Rows represent the individuals (respondents), columns represent the words used at least 10 times to answer the open-ended question (columns 1 to 115) and respondents' characteristics (age, health condition and gender)
Examples

```r
## Not run:
data(health)
res.cagalt<-CaGalt(Y=health[,1:115],X=health[,116:118],type="n")

## End(Not run)
```

**Description**

Performs a hierarchical multiple factor analysis, using an object of class list of data.frame.

**Usage**

```r
hmfa(X,H,type = rep("s", length(H[[1]])), ncp = 5, graph = TRUE,
axes = c(1,2), name.group = NULL)
```

**Arguments**

- **X**: a data.frame
- **H**: a list with one vector for each hierarchical level; in each vector the number of variables or the number of group constituting the group
- **type**: the type of variables in each group in the first partition; three possibilities: "c" or "s" for quantitative variables (the difference is that for "s", the variables are scaled in the program), "n" for categorical variables; by default, all the variables are quantitative and the variables are scaled unit
- **ncp**: number of dimensions kept in the results (by default 5)
- **graph**: boolean, if TRUE a graph is displayed
- **axes**: a length 2 vector specifying the components to plot
- **name.group**: a list of vector containing the name of the groups for each level of the hierarchy (by default, NULL and the group are named L1.G1, L1.G2 and so on)

**Value**

Returns a list including:

- **eig**: a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance
- **group**: a list with first a list of matrices with the coordinates of the groups for each level and second a matrix with the canonical correlation (correlation between the coordinates of the individuals and the partial points)
- **ind**: a list of matrices with all the results for the active individuals (coordinates, square cosine, contributions)
quant.var a list of matrices with all the results for the quantitative variables (coordinates, correlation between variables and axes)

quali.var a list of matrices with all the results for the supplementary categorical variables (coordinates of each categories of each variables, and v.test which is a criterion with a Normal distribution)

partial a list of arrays with the coordinates of the partial points for each partition

hobbies

hobbies (data)

Description
The data used here concern a questionnaire on hobbies. We asked to 8403 individuals how an- swer questions about their hobbies (18 questions). The following four variables were used to label the individuals: sex (male, female), age (15-25, 26-35, 36-45, 46-55, 56-65, 66-75, 76-85, 86-100), marital status (single, married, widowed, divorced, remarried), profession (manual labourer, unskilled worker, technician, foreman, senior management, employee, other). And finally, a quan- titative variable indicates the number of hobbies practised out of the 18 possible choices.

Usage
data(tea)

Format
A data frame with 8403 rows and 23 columns. Rows represent the individuals, columns represent the different questions. The first 18 questions are active ones, and the 4 following ones are supple- mentary categorical variables and the 23th is a supplementary quantitative variable (the number of activities)
Examples

data(hobbies)
## Not run:
res.mca <- MCA(hobbies, quali.sup=19:22, quanti.sup=23, method="Burt")
plot(res.mca, invisible=c("ind","quali.sup"), hab="quali")  ### active var. only
plot(res.mca, invisible=c("var","quali.sup"), cex=.5, label="none")  ### individuals only
plot(res.mca, invisible=c("ind","var"), hab="quali")  ### supp. qualitative var. only

dimdesc(res.mca)
plotellipses(res.mca, keepvar=1:4)

## End(Not run)

---

JO  

*Number of medals in athletism during olympic games per country*

Description

This data frame is a contingency table with the athletism events (in row) and the countries (in columns). Each cell gives the number of medals obtained during the 5 olympic games from 1992 to 2008 (Barcelona 1992, Atlanta 1996, Sydney 2000, Athens 2004, Beijing 2008).

Usage

data(JO)

Format

A data frame with the 24 events in athletism and in column the 58 countries who obtained at least one medal.

Examples

## Not run:
data(JO)
res.ca <- CA(JO)
res.ca <- CA(JO, axes = 3:4)

## End(Not run)
Multiple Correspondence Analysis (MCA)

Description

Performs Multiple Correspondence Analysis (MCA) with supplementary individuals, supplementary quantitative variables and supplementary categorical variables. Missing values are treated as an additional level, categories which are rare can be ventilated.

Usage

```r
MCA(x, ncp = 5, ind.sup = NULL, quanti.sup = NULL,
    quali.sup = NULL, graph = TRUE, level.ventil = 0,
    axes = c(1,2), row.w = NULL, method="Indicator",
    na.method="NA", tab.disj=NULL)
```

Arguments

- `x`: a data frame with \( n \) rows (individuals) and \( p \) columns (categorical variables)
- `ncp`: number of dimensions kept in the results (by default 5)
- `ind.sup`: a vector indicating the indexes of the supplementary individuals
- `quanti.sup`: a vector indicating the indexes of the quantitative supplementary variables
- `quali.sup`: a vector indicating the indexes of the categorical supplementary variables
- `graph`: boolean, if TRUE a graph is displayed
- `level.ventil`: a proportion corresponding to the level under which the category is ventilated; by default, 0 and no ventilation is done
- `axes`: a length 2 vector specifying the components to plot
- `row.w`: an optional row weights (by default, a vector of 1 for uniform row weights)
- `method`: a string corresponding to the name of the method used: "Indicator" (by default) is the CA on the Indicator matrix, "Burt" is the CA on the Burt table. For Burt and the Indicator, the graph of the individuals and the graph of the categories are given
- `na.method`: a string corresponding to the name of the method used if there are missing values; available methods are "NA" or "Average" (by default, "NA")
- `tab.disj`: optional data.frame corresponding to the disjunctive table used for the analysis; it corresponds to a disjunctive table obtained from imputation method (see package missMDA).

Value

Returns a list including:

- `eig`: a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance
var a list of matrices containing all the results for the active variables (coordinates, square cosine, contributions, v.test, square correlation ratio)

ind a list of matrices containing all the results for the active individuals (coordinates, square cosine)

ind.sup a list of matrices containing all the results for the supplementary individuals (coordinates, square cosine)

quanti.sup a matrix containing the coordinates of the supplementary quantitative variables (the correlation between a variable and an axis is equal to the variable coordinate on the axis)

quali.sup a list of matrices with all the results for the supplementary categorical variables (coordinates of each categories of each variables, square cosine and v.test which is a criterion with a Normal distribution, square correlation ratio)

call a list with some statistics

Returns the graphs of the individuals and categories and the graph with the variables.
The plots may be improved using the argument autolab, modifying the size of the labels or selecting some elements thanks to the `plot.MCA` function.

plot(res.mca, invisible=c("ind","quanti.sup"), hab="quali")
```
Multiple Factor Analysis (MFA)

Description

Performs Multiple Factor Analysis in the sense of Escofier-Pages with supplementary individuals and supplementary groups of variables. Groups of variables can be quantitative, categorical or contingency tables. Missing values in numeric variables are replaced by the column mean. Missing values in categorical variables are treated as an additional level.

Usage

```r
MFA(base, group, type = rep("s",length(group)), ind.sup = NULL,
    ncp = 5, name.group = NULL, num.group.sup = NULL,
    graph = TRUE, weight.col.mfa = NULL, row.w = NULL,
    axes = c(1,2), tab.comp=NULL)
```

Arguments

- **base**: a data frame with \(n\) rows (individuals) and \(p\) columns (variables)
- **group**: a vector with the number of variables in each group
- **type**: the type of variables in each group: four possibilities: "c" or "s" for quantitative variables (the difference is that for "s" variables are scaled to unit variance), "n" for categorical variables and "f" for frequencies (from a contingency tables); by default, all variables are quantitative and scaled to unit variance
- **ind.sup**: a vector indicating the indexes of the supplementary individuals
- **ncp**: number of dimensions kept in the results (by default 5)
- **name.group**: a vector containing the name of the groups (by default, NULL and the group are named group.1, group.2 and so on)
- **num.group.sup**: the indexes of the illustrative groups (by default, NULL and no group are illustrative)
- **graph**: boolean, if TRUE a graph is displayed

## Example with missing values: use the missMDA package

```r
require(missMDA)
data(vnf)
completed <- imputeMCA(vnf,ncp=2)
res.mca <- MCA(vnf,tab.disj=completed$tab.disj)
```

## End (Not run)
weight.col.mfa vector of weights, useful for HMFA method (by default, NULL and an MFA is performed)
row.w an optional row weights (by default, a vector of 1 for uniform row weights)
axes a length 2 vector specifying the components to plot
tab.comp object obtained from the imputeMFA function of the missMDA package that allows to handle missing values

Value
summary.quali a summary of the results for the categorical variables
summary.quanti a summary of the results for the quantitative variables
separate.analyses the results for the separate analyses
eig a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance
group a list of matrices containing all the results for the groups (Lg and RV coefficients, coordinates, square cosine, contributions, distance to the origin, the correlations between each group and each factor)
rapport.inertie inertia ratio
ind a list of matrices containing all the results for the active individuals (coordinates, square cosine, contributions)
ind.sup a list of matrices containing all the results for the supplementary individuals (coordinates, square cosine)
quanti.var a list of matrices containing all the results for the quantitative variables (coordinates, correlation between variables and axes, contribution, cos2)
quali.var a list of matrices containing all the results for categorical variables (coordinates of each categories of each variables, contribution and v.test which is a criterion with a Normal distribution)
freq a list of matrices containing all the results for the frequencies (coordinates, contribution, cos2)
quanti.var.sup a list of matrices containing all the results for the supplementary quantitative variables (coordinates, correlation between variables and axes, cos2)
quali.var.sup a list of matrices containing all the results for the supplementary categorical variables (coordinates of each categories of each variables, cos2 and v.test which is a criterion with a Normal distribution)
freq.sup a list of matrices containing all the results for the supplementary frequencies (coordinates, cos2)
partial.axes a list of matrices containing all the results for the partial axes (coordinates, correlation between variables and axes, correlation between partial axes)
global.pca the result of the analysis when it is considered as a unique weighted PCA

Returns the individuals factor map, the variables factor map and the groups factor map.
The plots may be improved using the argument autolab, modifying the size of the labels or selecting some elements thanks to the plot.MFA function.

**Description**

Dataset to illustrate the selection of variables in regression

**Usage**

data(milk)

**Format**

Dataset with 85 rows and 6 columns: 85 milks described by the 5 variables: density, fat content, protein, casein, dry, yield

**Examples**

data(milk)
res = RegBest(y=milk[,6],x=milk[-6])
res$best

---

**mortality**

*The cause of mortality in France in 1979 and 2006*

**Description**

The cause of mortality in France in 1979 and 2006.

**Usage**

data(mortality)

**Format**

A data frame with 62 rows (the different causes of death) and 18 columns. Each column corresponds to an age interval (15-24, 25-34, 35-44, 45-54, 55-64, 65-74, 75-84, 85-94, 95 and more) in a year. The 9 first columns correspond to data in 1979 and the 9 last columns to data in 2006. In each cell, the counts of deaths for a cause of death in an age interval (in a year) is given.

**Source**

Centre d’épidemiologie sur les causes medicales
**PCA**

Principal Component Analysis (PCA)

**Description**

Performs Principal Component Analysis (PCA) with supplementary individuals, supplementary quantitative variables and supplementary categorical variables. Missing values are replaced by the column mean.

**Usage**

PCA(X, scale.unit = TRUE, ncp = 5, ind.sup = NULL, quanti.sup = NULL, quali.sup = NULL, row.w = NULL, col.w = NULL, graph = TRUE, axes = c(1,2))

**Arguments**

- **X**
  a data frame with *n* rows (individuals) and *p* columns (numeric variables)
- **ncp**
  number of dimensions kept in the results (by default 5)
- **scale.unit**
  a boolean, if TRUE (value set by default) then data are scaled to unit variance
- **ind.sup**
  a vector indicating the indexes of the supplementary individuals
- **quanti.sup**
  a vector indicating the indexes of the quantitative supplementary variables
- **quali.sup**
  a vector indicating the indexes of the categorical supplementary variables
- **row.w**
  an optional row weights (by default, a vector of 1 for uniform row weights)
- **col.w**
  an optional column weights (by default, uniform column weights)
- **graph**
  boolean, if TRUE a graph is displayed
- **axes**
  a length 2 vector specifying the components to plot

**Examples**

data(mortality)

```r
## Not run:
res <- MFA(mortality, group = c(9, 9), type = c("f", "f"),
            name.group = c("1979", "2006"))

plot(res, choix = "freq", invisible = "ind", habillage = "group")
lines(res$freq$coord[1:9, 1], mfa$freq$coord[1:9, 2], col = "red")
lines(res$freq$coord[10:18, 1], mfa$freq$coord[10:18, 2], col = "green")
```

## End(Not run)
PCA

Value

Returns a list including:

- **eig**: a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance.
- **var**: a list of matrices containing all the results for the active variables (coordinates, correlation between variables and axes, square cosine, contributions).
- **ind**: a list of matrices containing all the results for the active individuals (coordinates, square cosine, contributions).
- **ind.sup**: a list of matrices containing all the results for the supplementary individuals (coordinates, square cosine).
- **quanti.sup**: a list of matrices containing all the results for the supplementary quantitative variables (coordinates, correlation between variables and axes).
- **quali.sup**: a list of matrices containing all the results for the supplementary categorical variables (coordinates of each categories of each variables, v.test which is a criterion with a Normal distribution, and eta2 which is the square correlation coefficient between a qualitative variable and a dimension).

Returns the individuals factor map and the variables factor map.
The plots may be improved using the argument autolab, modifying the size of the labels or selecting some elements thanks to the `plot.PCA` function.

plot.CA

Draw the Correspondence Analysis (CA) graphs

Description

Draw the Correspondence Analysis (CA) graphs.

Usage

## S3 method for class 'CA'
plot(x, axes = c(1, 2),
     xlim = NULL, ylim = NULL,
     invisible = c("none", "row", "col", "row.sup", "col.sup", "quali.sup"),
     choix = c("CA", "quanti.sup"), col.row = "blue", col.col = "red",
     col.row.sup = "darkblue", col.col.sup = "darkred",
     col.quali.sup = "magenta", col.quanti.sup = "blue",
     label = c("all", "none", "row", "row.sup", "col", "col.sup", "quali.sup"),
     title = NULL, palette = NULL, autoLab = c("auto", "yes", "no"),
     new.plot = FALSE, selectRow = NULL, selectCol = NULL,
     unselect = 0.7, shadowtext = FALSE, habillage = "none", ...)

Arguments

x an object of class CA
axes a length 2 vector specifying the components to plot
xlim range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
invisible string indicating if some points should be unlabelled ("row", "col", "row.sup", "col.sup", "quali.sup")
choix the graph to plot ("CA" for the CA map, "quanti.sup" for the supplementary quantitative variables)
col.row a color for the rows points
col.col a color for columns points
col.row.sup a color for the supplementary rows points
col.col.sup a color for supplementary columns points
col.quali.sup  a color for the supplementary categorical variables
col.quanti.sup  a color for the supplementary quantitative variables
label  a list of character for the elements which are labelled (by default, all the elements are labelled ("row", "row.sup", "col", "col.sup", "quali.sup")
title  string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
palette  the color palette used to draw the points. By default colors are chosen. If you want to define the colors : palette=palette(c("black","red","blue")); or you can use: palette=palette(rainbow(30)), or in black and white for example: palette=palette(gray(seq(0,.9,len=25)))
autoLab  if autoLab="auto", autoLab is equal to "yes" if there are less than 50 elements and "no" otherwise; if "yes", the labels of the drawn elements are placed in a "good" way (can be time-consuming if many elements), and if "no" the elements are placed quickly but may overlap
new.plot  boolean, if TRUE, a new graphical device is created
selectRow  a selection of the rows that are drawn; see the details section
selectCol  a selection of the columns that are drawn; see the details section
unselect  may be either a value between 0 and 1 that gives the transparency of the unselected objects (if unselect=1 the transparency is total and the elements are not drawn, if unselect=0 the elements are drawn as usual but without any label) or may be a color (for example unselect="grey60")
shadowtext  boolean; if true put a shadow on the labels (rectangles are written under the labels which may lead to difficulties to modify the graph with another program)
habillage  color the individuals among a categorical variable (give the number of the categorical supplementary variable or its name)
...  further arguments passed to or from other methods, such as cex, cex.main, ...

Details

The argument autoLab = "yes" is time-consuming if there are many labels that overlap. In this case, you can modify the size of the characters in order to have less overlapping, using for example cex=0.7.

The selectRow and selectCol arguments can be used in order to select a part of the elements that are drawn. For example, you can use:

selectRow  = 1:5 and then the rows 1 to 5 are drawn.
select  = c("name1","name5") and then the rows that have the names name1 and name5 are drawn.
select  = "coord 10" and then the 10 rows (10 active and 10 supplementaries) that have the highest (squared) coordinates on the 2 chosen dimensions are drawn.
select  = "contrib 10" and then the 10 rows (10 active) that have the highest contribution on the 2 dimensions of your plot are drawn.
select  = "cos2 5" and then the 5 rows (5 actives and 5 supplementaries) that have the highest cos2 on the 2 dimensions of your plot are drawn.
select  = "dist 8" and then the 8 rows (8 actives and 8 supplementaries) that have the highest distance to the center of gravity are drawn.
Value

Returns the factor map with the joint plot of CA.

plot.CaGalt  

Draw the Correspondence Analysis on Generalised Aggregated Lexical Table (CaGalt) graphs

Description

Plot the graphs for a Correspondence Analysis on Generalised Aggregated Lexical Table (CaGalt).

Usage

## S3 method for class 'CaGalt'
plot(x, axes = c(1, 2), choix = c("ind", "freq", "quali.var", "quanti.var"),
      conf.ellip = FALSE, contr.ellipse = 3, xlim = NULL, ylim = NULL, col.ind = "black",
      col.freq = "darkred", col.quali = "blue", col.quanti = "blue", label = TRUE,
      lim.cos2.var = 0, title = NULL, palette = NULL,
      autoLab = c("auto", "yes", "no"), new.plot = FALSE, select = NULL,
      unselect = 0.7, shadowtext = FALSE, ...)

Arguments

x  
an object of class CaGalt

axes  
a length 2 vector specifying the components to plot

choix  
the graph to plot ("ind" for the individuals, "freq" for the frequencies, "quali.var" for the categorical variables, "quanti.var" for the quantitative variables)

cnf.ellip  
boolean (FALSE by default), if TRUE, draw ellipses around the frequencies and the variables

contr.ellipse  
the confidence ellipses were drawn for the frequencies with a contribution higher than X times of mean contribution on the 2 dimensions of your plot (by default 3)
xlim
range for the plotted 'x' values, defaulting to the range of the finite values of 'x'

ylim
range for the plotted 'y' values, defaulting to the range of the finite values of 'y'

col.ind
a color for the individuals (by default "black")
col.freq
a color for the frequencies (by default "darkred")
col.quali
a color for the categories of categorical variables (by default "blue")
col.quant
a color for the quantitative variables (by default "blue")

label
the labels are drawn (by default TRUE)

lim.cos2.var
value of the square cosinus under the variables are not drawn

title
string corresponding to the title of the graph you draw (by default NULL and a

title is chosen)
palette
the color palette used to draw the points. By default colors are chosen. If you

want to define the colors: palette=palette(c("black","red","blue")); or you can

use: palette=palette(rainbow(30)), or in black and white for example: palette=palette(gray(seq(0,.9,len=25)))

autoLab
if autoLab="auto", autoLab is equal to "yes" if there are less than 50 elements

and "no" otherwise; if "yes", the labels of the drawn elements are placed in a

"good" way (can be time-consuming if many elements), and if "no" the elements

are placed quickly but may overlap

new.plot
boolean, if TRUE, a new graphical device is created

select
a selection of the elements that are drawn; see the details section

unselect
may be either a value between 0 and 1 that gives the transparency of the unse-
lected objects (if unselect=1 the transparency is total and the elements are not
drawn, if unselect=0 the elements are drawn as usual but without any label) or

may be a color (for example unselect="grey60")

shadowtext
boolean; if true put a shadow on the labels (rectangles are written under the

labels which may lead to difficulties to modify the graph with another program)

... further arguments passed to or from other methods, such as cex, cex.main, ...

Details
The argument autoLab = "yes" is time-consuming if there are many labels that overlap. In this
case, you can modify the size of the characters in order to have less overlapping, using for example

cex=0.7. The select argument can be used in order to select a part of the elements (individuals

if you draw the graph of individuals, or variables if you draw the graph of variables) that are
drawn. For example, you can use: select = 1:5 and then the elements 1:5 are drawn. select =
c("name1","name5") and then the elements that have the names name1 and name5 are drawn. se-
lect = "coord 10" and then the 10 elements that have the highest (squared) coordinates on the 2
chosen dimensions are drawn. select = "contrib 10" and then the 10 elements that have the high-
est contribution on the 2 dimensions of your plot are drawn (available only when frequencies are
drawn). select = "cos2 5" and then the 5 elements that have the highest cos2 on the 2 dimensions of
your plot are drawn.

Value

Returns the individuals, the frequencies and the variables factor map.

plot.catdes

Plots for description of clusters (catdes)

Description
Plots a graph from a catdes output.

Usage

```r
## S3 method for class 'catdes'
plot(x,col="deepskyblue",show="all",numchar=10,...)
```

Arguments

- `x` A catdes object, see catdes for details.
- `col` The color of the bars.
- `show` a string. If "quali", only the categorical variables are used. If "quanti", only the quantitative variables are used. If "all", both quali and quanti are used.
- `numchar` number of characters for the labels
- `...` further arguments passed to or from other methods

Value
Returns choosen plot.

plot.DMFA

Draw the Dual Multiple Factor Analysis (DMFA) graphs

Description

Plot the graphs for a Principal Component Analysis (DMFA) with supplementary individuals, supplementary quantitative variables and supplementary categorical variables.

Usage

## S3 method for class 'DMFA'
plot(x, axes = c(1, 2), choix = "ind", label="all",
     lim.cos2.var = 0., xlim=NULL, ylim=NULL, title = NULL,
     palette = NULL, new.plot = FALSE,
     autoLab = c("auto","yes","no"), ...)

Arguments

x an object of class DMFA
axes a length 2 vector specifying the components to plot
choix the graph to plot ("ind" for the individuals, "var" for the variables)
label a list of character for the elements which are labelled (by default, all the elements are labelled ("ind", "ind.sup", "quali", "var", "quanti.sup"))
lim.cos2.var value of the square cosinus under the variables are not drawn
xlim range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
title string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
plot.FAMD

- **palette**: the color palette used to draw the points. By default colors are chosen. If you want to define the colors: `palette=palette(c("black","red","blue"));` or you can use: `palette=palette(rainbow(30)),` or in black and white for example: `palette=palette(gray(seq(0,.9,len=25)))`.

- **new.plot**: boolean, if TRUE, a new graphical device is created.

- **autoLab**: if autoLab="auto", autoLab is equal to "yes" if there are less than 50 elements and "no" otherwise; if "yes", the labels of the drawn elements are placed in a "good" way (can be time-consuming if many elements), and if "no" the elements are placed quickly but may overlap.

- ... further arguments passed to or from other methods.

### Value

Returns the individuals factor map and the variables factor map, the partial variables representation and the groups factor map.

Elisabeth Morand, Francois Husson <Francois.Husson@agrocampus-ouest.fr>

**See Also**

gpa

Plots for Hierarchical Classification on Principle Components (HCPC) results

---

### Description

Plots graphs from a HCPC result: tree, barplot of inertia gains and first factor map with or without the tree, in 2 or 3 dimensions.

### Usage

```r
## S3 method for class 'HCPC'
plot(x, axes=c(1,2), choice="3D.map", rect=TRUE,
     draw.tree=TRUE, ind.names=TRUE, t.level="all", title=NULL,
     new.plot=FALSE, max.plot=15, tree.barplot=TRUE,
     centers.plot=FALSE, ...)
```

### Arguments

- **x**: A HCPC object, see HCPC for details.
- **axes**: A two integers vector. Defines the axes of the factor map to plot.
- **choice**: A string. "tree" plots the tree. "bar" plots bars of inertia gains. "map" plots a factor map, individuals colored by cluster. "3D.map" plots the same factor map, individuals colored by cluster, the tree above.
- **rect**: A boolean. If TRUE, rectangles are drawn around clusters if choice = "tree".
- **tree.barplot**: A boolean. If TRUE, the barplot of intra inertia losses is added on the tree graph.
- **draw.tree**: A boolean. If TRUE, the tree is projected on the factor map if choice = "map".
- **ind.names**: A boolean. If TRUE, the individuals names are added on the factor map when choice = "3D.map"
- **t.level**: Either a positive integer or a string. A positive integer indicates the starting level to plot the tree on the map when draw.tree=TRUE. If "all", the whole tree is plotted. If "centers", it draws the tree starting t the centers of the clusters.
- **title**: A string. Title of the graph. NULL by default and a title is automatically defined.
plot.HMFA

centers.plot a boolean. If TRUE, the centers of clusters are drawn on the 3D factor maps.
new.plot a boolean. If TRUE, the plot is done in a new window.
max.plot The max for the bar plot
... Other arguments from other methods.

Value

Returns choosen plot.

plot.HMFA Draw the Hierarchical Multiple Factor Analysis (HMFA) graphs

Description

Draw the Hierarchical Multiple Factor Analysis (HMFA) graphs

Usage

## S3 method for class 'HMFA'
plot(x, axes = c(1,2),num=6, choix = "ind",
   lab.grpe = TRUE, lab.var = TRUE, lab.ind.moy = TRUE,
   invisible = NULL, lim.cos2.var = 0.,
   xlim = NULL, ylim = NULL, cex = 1, title = NULL, new.plot = FALSE, ...)

Arguments

x an object of class HMFA
axes a length 2 vector specifying the components to plot
num number of graphs in a same windows
choix: a string corresponding to the graph that you want to do ("ind" for the individual or categorical variables graph, "var" for the quantitative variables graph, "axes" for the graph of the partial axes, "group" for the groups representation)

lab.grp: boolean, if TRUE, the label of the groups are drawn

lab.var: boolean, if TRUE, the label of the variables are drawn

lab.ind.moy: boolean, if TRUE, the label of the mean points are drawn

invisible: list of string; for choix = "ind", the individuals can be omit (invisible = "ind"), or the centers of gravity of the categorical variables (invisible= "quali")

lim.cos2.var: value of the square cosinus under with the points are not drawn

xlim: range for the plotted 'x' values, defaulting to the range of the finite values of 'x'

ylim: range for the plotted 'y' values, defaulting to the range of the finite values of 'y'

cex: cf. function par in the graphics package

title: string corresponding to the title of the graph you draw (by default NULL and a title is chosen)

new.plot: boolean, if TRUE, a new graphical device is created

... further arguments passed to or from other methods

Value

Returns the individuals factor map and the variables factor map.

HMFA

Examples

data(wine)
hierar <- list(c(2,5,3,10,9,2), c(4,2))
res.hmfa <- HMFA(wine, H = hierar, type=c("n",rep("s",5)), graph = FALSE)
plot(res.hmfa, invisible="quali")
plot(res.hmfa, invisible="ind")
Draw the Multiple Correspondence Analysis (MCA) graphs.

Usage

```r
## S3 method for class 'MCA'
plot(x, axes = c(1, 2), choix=c("ind","var","quanti.sup"),
     xlim = NULL, ylim = NULL,
     invisible = c("none","ind","var","ind.sup","quali.sup","quanti.sup"),
     col.ind = "blue", col.var = "red", col.quali.sup = "darkgreen",
     col.ind.sup = "darkblue", col.quanti.sup = "blue",
     label = c("all","none","ind","var","ind.sup","quali.sup","quanti.sup"),
     title = NULL, habillage = "none",
     palette = NULL, autoLab = c("auto","yes","no"), new.plot = FALSE,
     select = NULL, selectMod = NULL, unselect = 0.7,
     shadowtext = FALSE, ...)
```

Arguments

- `x` an object of class MCA
- `axes` a length 2 vector specifying the components to plot
- `choix` the graph to plot ("ind" for the individuals and the categories, "var" for the variables, "quanti.sup" for the supplementary quantitative variables)
- `xlim` range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
- `ylim` range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
- `invisible` string indicating if some points should not be drawn ("ind", "var", "ind.sup", "quali.sup", "quanti.sup")
- `col.ind` a color for the individuals, if color ="none" the label is not written
- `col.var` a color for the categories of categorical variables, if color ="none" the label is not written
- `col.quali.sup` a color for the categorical supplementary variables, if color ="none" the label is not written
- `col.ind.sup` a color for the supplementary individuals only if there is not habillage, if color ="none" the label is not written
- `col.quanti.sup` a color for the supplementary quantitative variables, if color ="none" the label is not written
- `label` print the labels of the points; "all" print all the labels; may be a vector with "ind" (for the individuals),"ind.sup" (for the supplementary individuals), "var" (for the active categories), "quali.sup" "var" (for the supplementary categories)
plot.MCA

**title**  
string corresponding to the title of the graph you draw (by default NULL and a title is chosen)

**habillage**  
string corresponding to the color which are used. If "none", one color is used for the individual, another one for the categorical variables; if "quali", one color is used for each categorical variables; else if it is the position of a categorical variable, it colors according to the different categories of this variable

**palette**  
the color palette used to draw the points. By default colors are chosen. If you want to define the colors: palette=palette(c("black","red","blue")); or you can use: palette=palette(rainbow(30)), or in black and white for example: palette=palette(gray(seq(0,.9,len=25)))

**autoLab**  
if autoLab="auto", autoLab is equal to "yes" if there are less than 50 elements and "no" otherwise; if "yes", the labels of the drawn elements are placed in a "good" way (can be time-consuming if many elements), and if "no" the elements are placed quickly but may overlap

**new.plot**  
boolean, if TRUE, a new graphical device is created

**select**  
a selection of the elements that are drawn; see the details section

**selectMod**  
a selection of the categories that are drawn; see the details section

**unselect**  
may be either a value between 0 and 1 that gives the transparency of the unselected objects (if unselect=1 the transparency is total and the elements are not drawn, if unselect=0 the elements are drawn as usual but without any label) or may be a color (for example unselect="grey60")

**shadowtext**  
boolean; if true put a shadow on the labels (rectangles are written under the labels which may lead to difficulties to modify the graph with another program)

...  
further arguments passed to or from other methods, such as cex, cex.main, ...

**Details**

The argument autoLab = "yes" is time-consuming if there are many labels that overlap. In this case, you can modify the size of the characters in order to have less overlapping, using for example cex=0.7.

The select argument can be used in order to select a part of the elements (individuals if you draw the graph of individuals, or variables if you draw the graph of variables) that are drawn. For example, you can use:

select = 1:5 and then the elements 1:5 are drawn.

select = c("name1","name5") and then the elements that have the names name1 and name5 are drawn.

select = "coord 10" and then the 10 elements that have the highest (squared) coordinates on the 2 chosen dimensions are drawn.

select = "contrib 10" and then the 10 elements that have the highest contribution on the 2 dimensions of your plot are drawn.

select = "cos2 5" and then the 5 elements that have the highest cos2 on the 2 dimensions of your plot are drawn.

select = "dist 8" and then the 8 elements that have the highest distance to the center of gravity are drawn.

The selectMod argument can be used in order to select the categories that are drawn.
plot.MFA

     chrono = FALSE, xlim = NULL, ylim = NULL,
     title = NULL, palette = NULL,
     autoLab = c("auto","yes","no"), new.plot = FALSE,
     select = NULL, unselect = 0.7, shadowtext = FALSE, ...)
Arguments

x  
an object of class MFA
choix  
a string corresponding to the graph that you want to do ("ind" for the individual or categorical variables graph, "var" for the quantitative variables graph, "freq" for the frequency or contingency tables, "axes" for the graph of the partial axes, "group" for the groups representation)
axes  
a length 2 vector specifying the components to plot
ellipse  
boolean (NULL by default), if not null, draw ellipses around the individuals, and use the results of coord.ellipse
ellipse.par  
boolean (NULL by default), if not null, draw ellipses around the partial individuals, and use the results of coord.ellipse
lab.grpe  
boolean, if TRUE, the labels of the groups are drawn
lab.var  
boolean, if TRUE, the labels of the variables are drawn
lab.ind  
boolean, if TRUE, the labels of the mean points are drawn
lab.par  
boolean, if TRUE, the labels of the partial points are drawn
lab.col  
boolean, if TRUE, the labels of the columns for the contingency tables are drawn
habillage  
string corresponding to the color which are used. If "ind", one color is used for each individual; if "group" the individuals are colored according to the group; else if it is the name or the position of a categorical variable, it colors according to the different categories of this variable
col.hab  
the colors to use. By default, colors are chosen
invisible  
list of string; for choix ="ind", the individuals can be omit (invisible = "ind"), or supplementary individuals (invisible="ind.sup") or the center of gravity of the categorical variables (invisible= "quali" or "quali.sup" for the supplementary categories); if invisible = c("ind","ind.sup"), just the centers of gravity are drawn; if choix="var", invisible="quanti" suppress the active variable and invisible = "quanti.sup" suppress the supplementary variables
partial  
list of the individuals or of the center of gravity for which the partial points should be drawn (by default, partial = NULL and no partial points are drawn)
lim.cos2.var  
value of the square cosinus under with the points are not drawn
chrono  
boolean, if TRUE, the partial points of a same point are linked (useful when groups correspond to different moment)
xlim  
range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim  
range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
title  
string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
palette  
the color palette used to draw the points. By default colors are chosen. If you want to define the colors : palette=palette(c("black","red","blue")); or you can use: palette=palette(rainbow(30)), or in black and white for example: palette=palette(gray(seq(0,.9,len=25))
autolab  
if autolab="auto", autolab is equal to "yes" if there are less than 50 elements and "no" otherwise; if "yes", the labels of the drawn elements are placed in a "good" way (can be time-consuming if many elements), and if "no" the elements are placed quickly but may overlap
new.plot  boolean, if TRUE, a new graphical device is created

select  a selection of the elements that are drawn; see the details section

unselect  may be either a value between 0 and 1 that gives the transparency of the unselected objects (if unselect=1 the transparceny is total and the elements are not drawn, if unselect=0 the elements are drawn as usual but without any label) or may be a color (for example unselect="grey60")

shadowtext  boolean; if true put a shadow on the labels (rectangles are written under the labels which may lead to difficulties to modify the graph with another program)

...  further arguments passed to or from other methods, such as cex, cex.main, ...

Details

The argument autoLab = "yes" is time-consuming if there are many labels that overlap. In this case, you can modify the size of the characters in order to have less overlapping, using for example cex=0.7.

The select argument can be used in order to select a part of the elements (individuals if you draw the graph of individuals, or variables if you draw the graph of variables) that are drawn. For example, you can use:

select = 1:5 and then the elements 1:5 are drawn.
select = c("name1","name5") and then the elements that have the names name1 and name5 are drawn.
select = "coord 10" and then the 10 elements (individuals, variables, frequencies) that have the highest (squared) coordinates on the 2 chosen dimensions are drawn.
select = "contrib 10" and then the 10 elements (individuals, variables, frequencies) that have the highest contribution on the 2 dimensions of your plot are drawn.
select = "cos2 5" and then the 5 elements (individuals, variables, frequencies) that have the highest cos2 on the 2 dimensions of your plot are drawn.
selectMod = "contrib 5", the 5 categories that contribute the most to the two dimensions are drawn.
selectMod = "cos2 0.5", the categories that have a cos2 greater than 0.5 on the two dimensions are drawn.
selectMod = "v.test 2", the categories that have a v.test higher than the value on one of the two dimensions are drawn.

Value

Returns the individuals factor map and the variables factor map.

## End(Not run)
```

Description

Plot the graphs for a Principal Component Analysis (PCA) with supplementary individuals, supplementary quantitative variables and supplementary categorical variables.
**Usage**

```r
## S3 method for class 'PCA'
plot(x, axes = c(1, 2), choix = c("ind","var"),
     ellipse = NULL, xlim = NULL, ylim = NULL, habillage="none",
     col.hab = NULL, col.ind="black", col.ind.sup="blue",
     col.quali="magenta", col.quanti.sup="blue", col.var="black",
     label = c("all","none","ind","ind.sup","quali","var","quanti.sup"),
     invisible = c("none","ind","ind.sup","quali","var","quanti.sup"),
     lim.cos2.var = 0., title = NULL, palette=NULL,
     autoLab = c("auto","yes","no"), new.plot = FALSE, select = NULL,
     unselect = 0.7, shadowtext = FALSE, ...)
```

**Arguments**

- **x**: an object of class PCA
- **axes**: a length 2 vector specifying the components to plot
- **choix**: the graph to plot ("ind" for the individuals, "var" for the variables)
- **ellipse**: boolean (NULL by default), if not null, draw ellipses around the individuals, and use the results of `coord.ellipse`
- **xlim**: range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
- **ylim**: range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
- **habillage**: give no color for the individuals ("none"), a color for each individual ("ind"), or color the individuals among a categorical variable (give the number of the categorical variable)
- **col.hab**: a vector with the color to use for the individuals
- **col.ind**: a color for the individuals only if there is not habillage
- **col.ind.sup**: a color for the supplementary individuals only if there is not habillage
- **col.quali**: a color for the categories of categorical variables only if there is not habillage
- **col.quanti.sup**: a color for the quantitative supplementary variables
- **col.var**: a color for the variables
- **label**: a list of character for the elements which are labelled (by default, all the elements are labelled ("ind", ind.sup", "quali", "var", "quanti.sup"))
- **invisible**: string indicating if some points should not be drawn ("ind", "ind.sup" or "quali" for the individual graph and "var" or "quanti.sup" for the correlation circle graph)
- **lim.cos2.var**: value of the square cosinus under the variables are not drawn
- **title**: string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
- **palette**: the color palette used to draw the points. By default colors are chosen. If you want to define the colors : palette=palette(c("black","red","blue")); or you can use: palette=palette(rainbow(30)), or in black and white for example: palette=palette(gray(seq(0,1,len=25)))
autoLab

if autoLab="auto", autoLab is equal to "yes" if there are less than 50 elements and "no" otherwise; if "yes", the labels of the drawn elements are placed in a "good" way (can be time-consuming if many elements), and if "no" the elements are placed quickly but may overlap.

new.plot

boolean, if TRUE, a new graphical device is created

select

a selection of the elements that are drawn; see the details section

unselect

may be either a value between 0 and 1 that gives the transparency of the unselected objects (if unselect=1 the transparency is total and the elements are not drawn, if unselect=0 the elements are drawn as usual but without any label) or may be a color (for example unselect="grey60")

shadowtext

boolean; if true put a shadow on the labels (rectangles are written under the labels which may lead to difficulties to modify the graph with another program)

... further arguments passed to or from other methods, such as cex, cex.main, ...

Details

The argument autoLab = "yes" is time-consuming if there are many labels that overlap. In this case, you can modify the size of the characters in order to have less overlapping, using for example cex=0.7.

The select argument can be used in order to select a part of the elements (individuals if you draw the graph of individuals, or variables if you draw the graph of variables) that are drawn. For example, you can use:

select = 1:5 and then the elements 1:5 are drawn.

select = c("name1","name5") and then the elements that have the names name1 and name5 are drawn.

select = "coord 10" and then the 10 elements that have the highest (squared) coordinates on the 2 chosen dimensions are drawn.

select = "contrib 10" and then the 10 elements that have the highest contribution on the 2 dimensions of your plot are drawn.

select = "cos2 5" and then the 5 elements that have the highest cos2 on the 2 dimensions of your plot are drawn.

select = "dist 8" and then the 8 elements that have the highest distance to the center of gravity are drawn.

Value

Returns the individuals factor map and the variables factor map.

plot(res.pca,choix="var",select="cos2 0.6") #plot the variables that have a cos2 greater than 0.6

Description

Draw the specific Multiple Correspondence Analysis (spMCA) graphs.

Usage

## S3 method for class 'spMCA'
plot(x, axes = c(1, 2), choix=c("ind","var","quanti.sup"),
     xlim = NULL, ylim = NULL, invisible = NULL,
     col.ind = "blue", col.var = "red", col.quali.sup = "darkgreen",
     col.ind.sup = "darkblue", col.quanti.sup = "blue",
     label = "all", cex = 1, title = NULL, habillage = "none",
     palette = NULL, autoLab = c("auto","yes","no"), new.plot = FALSE,
     select = NULL, selectMod = NULL, unselect = 0.7, ...)

Arguments

x an object of class spMCA
axes a length 2 vector specifying the components to plot
choix the graph to plot ("ind" for the individuals and the categories, "var" for the variables)
xlim range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
ylim range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
invisible string indicating if some points should not be drawn ("ind", "var")
col.ind a color for the individuals, if color ="none" the label is not written
col.var a color for the categories of categorical variables, if color ="none" the label is not written
col.quali.sup not used. a color for the categorical supplementary variables, if color ="none" the label is not written
col.ind.sup not used. a color for the supplementary individuals only if there is not habillage, if color = "none" the label is not written

col.quanti.sup not used. a color for the supplementary quantitative variables, if color = "none" the label is not written

label print the labels of the points

cex cf. function \texttt{par} in the \texttt{graphics} package

title string corresponding to the title of the graph you draw (by default NULL and a title is chosen)

habillage string corresponding to the color which are used. If "none", one color is used for the individual, another one for the categorical variables; if "quali", one color is used for each categorical variables; else if it is the position of a categorical variable, it colors according to the different categories of this variable

palette the color palette used to draw the points. By default colors are chosen. If you want to define the colors: \texttt{palette=palette(c("black","red","blue"))}; or you can use: \texttt{palette=palette(rainbow(30))}, or in black and white for example: \texttt{palette=palette(gray(seq(0,.9,len=25)))}

autoLab if \texttt{autoLab= "auto"}, \texttt{autoLab} is equal to "yes" if there are less than 50 elements and "no" otherwise; if "yes", the labels of the drawn elements are placed in a "good" way (can be time-consuming if many elements), and if "no" the elements are placed quickly but may overlap

new.plot boolean, if TRUE, a new graphical device is created

select a selection of the elements that are drawn; see the details section

selectMod a selection of the categories that are drawn; see the details section

unselect may be either a value between 0 and 1 that gives the transparency of the unselected objects (if \texttt{unselect=1} the transparency is total and the elements are not drawn, if \texttt{unselect=0} the elements are drawn as usual but without any label) or may be a color (for example \texttt{unselect="grey60"})

... further arguments passed to or from other methods, such as cex, cex.main, ...

Value

Returns the individuals factor map and the variables factor map.

res <- spMCA (poison[,3:8], excl=c(1,3))
plot(res,invisible="ind")
plot(res,invisible="var")
### Categories that have a cos² less than 0.6 are not drawn
plot(res,invisible="var",selectMod="cos² 0.6")
plot(res,choix="var")

---

**plotellipses**

*Draw confidence ellipses around the categories*

---

**Description**

Draw confidence ellipses around the categories.

**Usage**

`plotellipses(model, keepvar = "all", axis = c(1, 2), means = TRUE, level = 0.95, magnify = 2, cex = 0.5, pch = 20, pch.means = 15, type = c("g", "p"), keepnames = TRUE, namescat = NULL, xlim = NULL, ylim = NULL, lwd = 1, label = "all", autoLab = c("auto", "yes", "no"),...)

**Arguments**

- **model**: an object of class MCA or PCA or MFA
- **keepvar**: a boolean or numeric vector of indexes of variables or a character vector of names of variables. If keepvar is "all", "quali" or "quali.sup" variables which are plotted are all the categorical variables, only those which are used to compute the dimensions (active variables) or only the supplementary categorical variables. If keepvar is a numeric vector of indexes or a character vector of names of variables, only relevant variables are plotted.
- **axis**: a length 2 vector specifying the components to plot
- **means**: boolean which indicates if the confidence ellipses are for (the coordinates of) the means of the categories (the empirical variance is divided by the number of observations) or for (the coordinates of) the observations of the categories
- **level**: the confidence level for the ellipses
- **magnify**: numeric which control how the level names are magnified. A value of 2 means that the level names have character expansion equal to two times cex
- **cex**: cf. function `par` in the `graphics` package
- **pch**: plotting character for coordinates, cf. function `par` in the `graphics` package
- **pch.means**: plotting character for means, cf. function `par` in the `graphics` package
- **type**: cf. function `xyplot` in the `lattice` package
- **keepnames**: a boolean or numeric vector of indexes of variables or a character vector of names of variables. If keepnames is TRUE, names of levels are taken from the (modified) dataset extracted from modele, if FALSE trimming names is done. When trimming, names of levels are taken from the (modified) dataset extracted from modele, then, the corresponding number of characters of names of original variables plus 1 is removed. If keepnames is a vector of indexes or names, trimming is done on all variables excepted whose in keepnames
namescat: a vector giving for each observation the value of categorical variable, each variable are stacked under each other. If NULL, names are taken from the (modified) dataset extracted from modele

xlim: range for the plotted 'x' values, defaulting to the range of the finite values of 'x'

ylim: range for the plotted 'y' values, defaulting to the range of the finite values of 'y'

lwd: The line width, a positive number, defaulting to 1

label: a list of character for the elements which are labelled (by default, "all", you can use "none", "ind", ind.sup))

autoLab: if autoLab="auto", autoLab is equal to "y" if there are less than 50 elements and "no" otherwise; if "y", the labels of the drawn elements are placed in a "good" way (can be time-consuming if many elements), and if "no" the elements are placed quickly but may overlap

... further arguments passed to or from other methods

Value

Return a graph with the ellipses. If only one variable is chosen, the graph is different.

plotGPApartial

*Draw an interactive General Procrustes Analysis (GPA) map*

**Description**

Draw an interactive General Procrustes Analysis (GPA) map. The graph is interactive and clicking on a point will draw the partial points, if you click on a point for which the partial points are yet drawn, the partial points are deleted. To stop the interactive plot, click on the title (or in the top of the graph).

**Usage**

```r
plotGPApartial(x, axes = c(1, 2),
lab.ind.moy = TRUE, habillage = "ind",
chrono = FALSE, draw.partial = NULL,
xlim = NULL, ylim = NULL, cex = 1, title = NULL, palette = NULL, ...)
```

**Arguments**

- `x` an object of class GPA
- `axes` a length 2 vector specifying the components to plot
- `lab.ind.moy` boolean, if TRUE, the label of the mean points are drawn
- `habillage` string corresponding to the color which are used. If "ind", one color is used for each individual; if "group" the individuals are colored according to the group
- `chrono` boolean, if TRUE, the partial points of a same point are linked (useful when groups correspond to different moment)
- `draw.partial` data frame of a boolean variable for all the individuals and all the centers of gravity and with for which the partial points should be drawn (by default, NULL and no partial points are drawn)
- `xlim` range for the plotted 'x' values, defaulting to the range of the finite values of 'x'
- `ylim` range for the plotted 'y' values, defaulting to the range of the finite values of 'y'
- `cex` cf. function `par` in the `graphics` package
- `title` string corresponding to the title of the graph you draw (by default NULL and a title is chosen)
- `palette` the color palette used to draw the points. By default colors are chosen. If you want to define the colors : `palette=palette(c("black","red","blue"));` or you can use: `palette=palette(rainbow(30)),` or in black and white for example: `palette=palette(gray(seq(0,.9,len=25)))`
- `...` further arguments passed to or from other methods

**Value**

Returns the General Procrustes Analysis map.

The data used here refer to a survey carried out on a sample of children of primary school who suffered from food poisoning. They were asked about their symptoms and about what they ate.

**Usage**

```r
data(poison)
```
Format
A data frame with 55 rows and 15 columns.

Examples

```r
data(poison)
res.mca <- MCA(poison, quanti.sup = 1:2, quali.sup=c(3,4))
```

---

poison.text  

**Poison**

Description
The data used here refer to a survey carried out on a sample of children of primary school who suffered from food poisoning. They were asked about their symptoms and about what they ate.

Usage

```r
data(poison)
```

Format
A data frame with 55 rows and 3 columns (the sex, if they are sick or not, and a textual variable with their symptom and what they eat).

Examples

```r
data(poison.text)
res.text <- textual(poison.text, num.text = 3, contingence.by = c(1,2))
## Contingence table for the sex variable, the sick variable and the couple
## of variable sick-sex
res.text2 <- textual(poison.text, num.text = 3, contingence.by = list(1,2,c(1,2)))
```

---

**Donnees genomiques sur les poulets**

Description
Donnees genomiques sur les poulets

Usage

```r
data(poulet)
```

## prefpls

**Description**

This function is useful to interpret the usual graphs $(x,y)$ with additional quantitative variables.

### Usage

```r
prefpls(donnee, var1 = 1, var2 = 2, firstvar = 3,
          lastvar = ncol(donnee), levels = c(0.2, 0.4, 0.6, 0.7, 0.8, 0.9, 1),
          asp = 1, nbchar = max(nchar(colnames(donnee))), title = NULL,
          choix = "var")
```

### Arguments

- `donnee`: a data frame made up of quantitative variables
- `var1`: the position of the variable corresponding to the x-axis
- `var2`: the position of the variable corresponding to the y-axis
- `firstvar`: the position of the first endogenous variable
- `lastvar`: the position of the last endogenous variable (by default the last column of `donnee`)
- `levels`: a list of the levels displayed in the graph of variables
- `asp`: aspect ratio for the graph of the individuals
nbchar: the number of characters used for the labels of the variables

title: string corresponding to the title of the graph you draw (by default NULL and a title is chosen)

choix: the graph to plot ("ind" for the individuals, "var" for the variables)

Details
This function is very useful when there is a strong correlation between two variables $x$ and $y$

Value
A scatter plot of the individuals
A graph with additional variables and the quality of representation contour lines.

print.GPA  

Print the Generalized Procrustes Analysis (GPA) results

Description

Print the Generalized Procrustes Analysis (GPA) results.

Usage

```r
## S3 method for class 'GPA'
print(x, file = NULL, sep = ";", ...)  
```

---
Arguments

- `x`: an object of class GPA
- `file`: A connection, or a character string naming the file to print to. If NULL (the default), the results are not printed in a file
- `sep`: character string to insert between the objects to print (if the argument file is not NULL)
- `...`: further arguments passed to or from other methods

Author(s)

Elisabeth Morand, Francois Husson <Francois.Husson@agrocampus-ouest.fr>

See Also

GPA, write.infile

Description

Print the Hierarchical Clustering on Principal Components (HCPC) results.

Usage

```r
## S3 method for class 'HCPC'
print(x, file = NULL, sep = ";", ...)  
```

Arguments

- `x`: an object of class HCPC
- `file`: A connection, or a character string naming the file to print to. If NULL (the default), the results are not printed in a file
- `sep`: character string to insert between the objects to print (if the argument file is not NULL)
- `...`: further arguments passed to or from other methods

Author(s)

Francois Husson <husson@agrocampus-ouest.fr>

HCPC, write.infile
**print.HMFA**

*Print the Hierarchical Multiple Factor Analysis results*

**Description**

Print the Hierarchical Multiple Factor Analysis results.

**Usage**

```r
## S3 method for class 'HMFA'
print(x, file = NULL, sep = ";", ...)```

**Arguments**

- `x`: an object of class HMFA
- `file`: A connection, or a character string naming the file to print to. If `NULL` (the default), the results are not printed in a file
- `sep`: character string to insert between the objects to print (if the argument file is not `NULL`
- `...`: further arguments passed to or from other methods

**Author(s)**

Sebastien Le, Francois Husson <Francois.Husson@agrocampus-ouest.fr>

**See Also**

**print.MCA**

*Print the Multiple Correspondance Analysis (MCA) results*

**Description**

Print the Multiple Correspondance Analysis (spMCA) results.

**Usage**

```r
## S3 method for class 'MCA'
print(x, file = NULL, sep = ";", ...)```
Arguments

x an object of class MCA
file A connection, or a character string naming the file to print to. If NULL (the default), the results are not printed in a file
sep character string to insert between the objects to print (if the argument file is not NULL
... further arguments passed to or from other methods

Author(s)

Francois Husson <Francois.Husson@agrocampus-ouest.fr>

print.MFA

Print the Multiple Factor Analysis results

Description

Print the Multiple Factor Analysis results.

Usage

## S3 method for class 'MFA'
print(x, file = NULL, sep = ";", ...)
print.PCA

Print the Principal Component Analysis (PCA) results

Description

Print the Principal Component Analysis (PCA) results.

Usage

## S3 method for class 'PCA'
print(x, file = NULL, sep = ",", ...)  

Arguments

x an object of class PCA
file A connection, or a character string naming the file to print to. If NULL (the default), the results are not printed in a file
sep character string to insert between the objects to print (if the argument file is not NULL
... further arguments passed to or from other methods

Author(s)

Jeremy Mazet, Francois Husson <Francois.Husson@agrocampus-ouest.fr>

See Also

PCA, write infile

Examples

---

## Not run:
data(decathlon)
res.pca <- PCA(decathlon, quanti.sup = 11:12, quali.sup = 13)
print(res.pca, file="c:/essai.csv", sep = ";")

## End(Not run)
print.spMCA

Print the specific Multiple Correspondance Analysis (spMCA) results

Description

Print the specific Multiple Correspondance Analysis (spMCA) results.

Usage

```r
## S3 method for class 'spMCA'
print(x, file = NULL, sep = ",", ...) 
```

Arguments

- `x`: an object of class spMCA
- `file`: A connection, or a character string naming the file to print to. If NULL (the default), the results are not printed in a file
- `sep`: character string to insert between the objects to print (if the argument file is not NULL)
- `...`: further arguments passed to or from other methods

Author(s)

Francois Husson <Francois.Husson@agrocampus-ouest.fr>

See Also

- `spmCA`, `write.infile`

reconst

Reconstruction of the data from the PCA, CA or MFA results

Description

Reconstruct the data from the PCA, CA or MFA results.

Usage

```r
reconst(res, ncp=NULL) 
```

Arguments

- `res`: an object of class PCA, CA or MFA
- `ncp`: number of dimensions used to reconstitute the data (by default NULL and the number of dimensions calculated for the PCA, CA or MFA is used)
RegBest

Value

Returns a data frame with the number of individuals and the number of variables used for the PCA, CA or MFA

Author(s)

Francois Husson <Francois.Husson@agrocampus-ouest.fr>, Julie Josse <Julie.Josse@agrocampus-ouest.fr>

See Also

PCA, CA, MFA

Examples

data(decathlon)
res.pca <- PCA(decathlon, quanti.sup = 11:12, quali.sup=13, graph=FALSE)
rec <- reconst(res.pca,ncp=2)

RegBest Select variables in multiple linear regression

Description

Find an optimal submodel

Usage

RegBest(y, x, int = TRUE, wt=NULL, na.action = na.omit, 
method=c("r2","Cp", "adjr2"), nbest=1)

Arguments

y A response vector
x A matrix of predictors
int Add an intercept to the model
wt Optional weight vector
na.action Handling missing values
method Calculate R-squared, adjusted R-squared or Cp to select the model. By default a the F-test on the r-square is used
nbest number of best models for each set of explained variables (by default 1)

Value

Returns the objects

all gives all the nbest best models for a given number of variables
best the best model
Description

Dataset to illustrate one-way and Two-way analysis of variance

Usage

data(senso)

Format

Dataset with 45 rows and 3 columns: Score, Product and Day

Examples

```r
## Example of 2-way analysis of variance
data(senso)
res <- AovSum (Score ~ Product + Day, data=senso)
res

## Example of 2-way analysis of variance with interaction
data(senso)
res2 <- AovSum (Score ~ Product + Day + Product : Day, data=senso)
res2
```
Simulate by bootstrap

Description
Simulate by bootstrap

Usage
simule(data, nb.simul)

Arguments
data A data frame from which the rows are the original data from which the simulation is calculated (by the average of a bootstrap sample). The columns correspond to the variables for which the simulation should be done. The first column must be a factor allowing to group the rows. A bootstrap simulation is done for each level of this factor.
nb.simul The number of simulations.

Details
The simulation is independently done for each level of the factor. The number of rows can be different for each level.

Value
mean Data.frame with all the levels of the factor variable, and for each variable, the mean of the original data.
simul Data.frame with all the levels of the factor variable, and for each variable, the nb.simul bootstrap simulations.
simul.mean Data.frame with all the levels of the factor variable, and for each variable, the mean of the simulated data.

Author(s)
Jeremy Mazet
spMCA

Specific Multiple Correspondence Analysis (spMCA)

Description
Performs Specific Multiple Correspondence Analysis (spMCA) with supplementary categories and supplementary categorical variables.

Usage
```
spMCA(x, excl=NULL, ncp=5, quali.sup=NULL, graph=TRUE)
```

Arguments
- `x` a data frame with `n` rows (individuals) and `p` columns (categorical variables)
- `excl` a vector with the indices of the categories to exclude
- `ncp` number of dimensions kept in the results (by default 5)
- `quali.sup` a vector indicating the indexes of the categorical supplementary variables
- `graph` boolean, if TRUE a graph is displayed

Value
Returns a list including:
- `eig` a matrix containing all the eigenvalues, the percentage of variance and the cumulative percentage of variance
- `ind` a list of matrices containing all the results for the active individuals (coordinates, contributions)
- `var` a list of matrices containing all the results for the active categories (coordinates, contribution, square cosine, v.test, eta2, contribution of the variables)
- `quali.sup` a list of matrices containing all the results for the supplementary categories (coordinates, square cosine, v.test)
- `call` a list with some statistics

Returns the graphs of the individuals and categories and the graph with the variables.

Author(s)
Francois Husson <husson@agrocampus-ouest.fr>,

Examples

```r
## Not run:
data (poison)
res <- spMCA (poison[,3:8], excl=c(1,3))

## End(Not run)
```

Description

Printing summaries of correspondence analysis objects

Usage

```r
## S3 method for class 'CA'
summary(object, nb.dec = 3, nbelements=10,
        ncp = 3, align.names=TRUE, file="", ...)
```

Arguments

- `object` an object of class CA
- `nb.dec` number of decimal printed
- `nbelements` number of elements written (rows, columns, ...) ; use `nbelements = Inf` if you want to have all the elements
- `ncp` number of dimensions printed
- `align.names` boolean, if TRUE the names of the objects are written using the same number of characters
- `file` a connection, or a character string naming the file to print to
- `...` further arguments passed to or from other methods, such as `cex`, `cex.main`, ...

**Description**

Printing summaries of Correspondence Analysis on Generalised Aggregated Lexical Table (CaGalt) objects

**Usage**

```r
## S3 method for class 'CaGalt'
summary(object, nb.dec = 3, nbelements = Inf, nbind = nbelements,
    ncp = 3, align.names = TRUE, file = "", ...)```

**Arguments**

- `object`: an object of class CaGalt
- `nb.dec`: number of printed decimals
- `nbelements`: number of written elements (variables, categories, frequencies); use `nbelements = Inf` if you want to have all the elements
- `nbind`: number of written elements; use `nbind = Inf` to have the results for all the individuals and `nbind = 0` if you do not want the results for individuals
- `ncp`: number of printed dimensions
- `align.names`: boolean, if TRUE the names of the objects are written using the same number of characters
- `file`: a connection, or a character string naming the file to print to

summary(res.cagalt)

## End(Not run)```
summary.FAMD

Printing summaries of FAMD objects

Description

Printing summaries of factor analysis on mixed data objects

Usage

```r
## S3 method for class 'FAMD'
summary(object, nb.dec = 3, nbelements=10,
         nbind=nbelements, ncp = 3, align.names=TRUE, file="", ...)  
```

Arguments

- **object**: an object of class FAMD
- **nb.dec**: number of decimal printed
- **nbelements**: number of elements written (variables, categories, ...); use `nbelements = Inf` if you want to have all the elements
- **nbind**: number of individuals written (individuals and supplementary individuals, ...); use `nbind = Inf` to have the results for all the individuals and `nbind = 0` if you do not want the results for individuals
- **ncp**: number of dimensions printed
- **align.names**: boolean, if TRUE the names of the objects are written using the same number of characters
- **file**: a connection, or a character string naming the file to print to

### svd.triplet

**Singular Value Decomposition of a Matrix**

**Description**

Compute the singular-value decomposition of a rectangular matrix with weights for rows and columns.

**Usage**

```
svd.triplet(X, row.w=NULL, col.w=NULL, ncp=Inf)
```

**Arguments**

- **X**: a data matrix
- **row.w**: vector with the weights of each row (NULL by default and the weights are uniform)
- **col.w**: vector with the weights of each column (NULL by default and the weights are uniform)
- **ncp**: the number of components kept for the outputs

**Value**

- **vs**: a vector containing the singular values of 'x';
- **u**: a matrix whose columns contain the left singular vectors of 'x';
- **v**: a matrix whose columns contain the right singular vectors of 'x'.

**See Also**

- [svd](#)

### tab.disjonctif

**Make a disjonctif table**

**Description**

Make a disjonctif table.

**Usage**

```
tab.disjonctif(tab)
```

**Arguments**

- **tab**: a data frame with factors
Value
The disjonctif table

\[ \text{tab.disjonctif.prop} \]

\textit{Make a disjunctive table when missing values are present}

Description
Create a disjunctive table. The missing values are replaced by the proportion of the category.

Usage
\[
\text{tab.disjonctif.prop}(\text{tab, seed=NULL, row.w=NULL})
\]

Arguments
- \text{tab}: a data frame with factors
- \text{row.w}: an optional row weights (by default, a vector of 1 for uniform row weights)
- \text{seed}: a single value, interpreted as an integer for the set.seed function (if seed = NULL, missing values are initially imputed by the mean of each variable)

Value
The disjonctif table.prop

\[ \text{tea} \]

\textit{tea (data)}

Description
The data used here concern a questionnaire on tea. We asked to 300 individuals how they drink tea (18 questions), what are their product’s perception (12 questions) and some personal details (4 questions).

Usage
data(tea)

Format
A data frame with 300 rows and 36 columns. Rows represent the individuals, columns represent the different questions. The first 18 questions are active ones, the 19th is a supplementary quantitative variable (the age) and the last variables are supplementary categorical variables.
Examples

```r
## Not run:
data(tea)
res.mca=MCA(tea,quanti.sup=19,quali.sup=20:36)
plot(res.mca,invisible=c("var","quali.sup","quanti.sup"),cex=0.7)
plot(res.mca,invisible=c("ind","quali.sup","quanti.sup"),cex=0.8)
plot(res.mca,invisible=c("quali.sup","quanti.sup"),cex=0.8)
dimdesc(res.mca)
plotellipses(res.mca,keepvar=1:4)

## make a hierarchical clustering: click on the tree to define the number of clusters
## HCPC(res.mca)
## End(Not run)
```

Description

Calculates the number of occurrence of each words and a contingence table

Usage

```r
textual(tab, num.text, contingence.by=1:ncol(tab),
        maj.in.min = TRUE, sep.word=NULL)
```

Arguments

- `tab`: a data frame with one textual variable
- `num.text`: indice of the textual variable
- `contingence.by`: a list with the indices of the variables for which a contingence table is calculated by default a contingence table is calculated for all the variables (except the textual one). A contingence table can also be calculated for couple of variables. If contingence.by is equal to num.text, then the contingence table is calculated for each row of the data table
- `maj.in.min`: boolean, if TRUE majuscule are transformed in minuscule
- `sep.word`: a string with all the characters which correspond to separator of words (by default sep.word = "; ()?.:/!$@\n;{][<>\@")

Value

Returns a list including:

- `cont.table`: the contingence table with in rows the categories of the categorical variables (or the couple of categories), and in column the words, and in each cell the number of occurrence
- `nb.words`: a data.frame with all the words and for each word, the number of lists in which it is present, and the number of occurrence
Author(s)

Francois Husson <Francois.Husson@agrocampus-ouest.fr>

See Also

CA, descfreq

Examples

data(poison.text)
res.text <- textual(poison.text, num.text = 3, contingence.by = 1)
descfreq(res.text$cont.table)
## Contingence table for the couple of variable sick-sex
res.text2 <- textual(poison.text, num.text = 3, contingence.by = list(c(1,2)))
descfreq(res.text2$cont.table)
## Contingence table for sex, sick and the couple of variable sick-sex
res.text2 <- textual(poison.text, num.text = 3, contingence.by = list(1,2,c(1,2)))

Description

The data used here refer to 21 wines of Val de Loire.

Usage

data(wine)

Format

A data frame with 21 rows (the number of wines) and 31 columns: the first column corresponds to the label of origin, the second column corresponds to the soil, and the others correspond to sensory descriptors.

Source

Centre de recherche INRA d'Angers

Examples

data(wine)

## Example of PCA
res.pca = PCA(wine,ncp=5, quali.sup = 1:2)

## Not run:
## Example of MCA
res.mca = MCA(wine,ncp=5, quanti.sup = 3:ncol(wine))
## Example of MFA

```r
code
```

```r
res.mfa = MFA(wine.group=c(2,5,3,10,9,2), type=c("n", rep("s",5)), ncp=5, 
  name.group=c("orig","olf","vis","olfag","gust","ens"), 
  num.group.sup=c(1,6), graph=FALSE)
plotellipses(res.mfa)
plotellipses(res.mfa, keepvar="Label") ## for 1 variable
```

```r
## End(Not run)
```

## Description

Print in a file.

## Usage

```r
write.infile(X, file, sep=";", append = FALSE, nb.dec=4)
```

## Arguments

- **X**: an object of class list, data.frame, matrix, ...
- **file**: A connection, or a character string naming the file to print to
- **sep**: character string to insert between the objects to print (if the argument file is not NULL)
- **append**: logical. If TRUE output will be appended to file; otherwise, it will overwrite the contents of file.
- **nb.dec**: number of decimal printed, by default 4

## Author(s)

Francois Husson <Francois.Husson@agrocampus-ouest.fr>

## Examples

```r
## Not run:
data(decathlon)
res.pca <- PCA(decathlon, quanti.sup = 11:12, quali.sup = 13)
write.infile(res.pca, file="c:/essai.csv", sep = ",")
```
